General Description
The MAX15006/MAX15007 ultra-low quiescent-current linear regulators are ideal for use in automotive and battery-operated systems. These devices operate from an input voltage of 4V to 40V, deliver up to 50mA of output current, and consume only 10μA of quiescent current at no load. The internal p-channel pass device keeps the quiescent current low even at full load. The MAX15007 consumes only 3μA current when in shutdown.

The MAX15006A/MAX15007A have a fixed 3.3V output while the MAX15006B/MAX15007B have a fixed 5V output voltage. The MAX15006C/MAX15007C feature an adjustable output from 1.8V to 10V. The MAX15007 includes an enable input to turn the device on or off. All devices are short-circuit protected and include thermal shutdown.

The MAX15006/MAX15007 operate over the -40°C to +125°C automotive temperature range. These devices are available in space-saving 3mm x 3mm 6-pin TDFN and 8-pin SO thermally enhanced packages.

Features
- Wide Operating Input Voltage Range (4V to 40V)
- Guaranteed 50mA Output Current
- Low Quiescent Current
  - 10μA (No Load) and 90μA (Full Load)
- Operates Through Cold-Crank Condition
- Withstands 45V Load Dump
- Low Dropout Voltage of 300mV (MAX15006B/MAX15007B)
- Stable Operation with Tiny 2.2μF Output Capacitor
- Enable Input (MAX15007)
- Preset 3.3V and 5.0V Output Voltages
- 1.8V to 10V Adjustable Output (MAX15006C/MAX15007C)
- Thermal and Short-Circuit Protection
- -40°C to +125°C Operating Temperature Range
- Thermally Enhanced 3mm x 3mm 6-Pin TDFN/8-Pin SO Packages

Pin Configurations

Pin Configurations continued at end of data sheet.
MAX15006/MAX15007
40V, Ultra-Low Quiescent-Current
Linear Regulators in 6-Pin TDFN/8-Pin SO

Absolute Maximum Ratings

- IN to GND: -0.3V to +45V
- EN to GND: -0.3V to +45V
- OUT, FB to GND: -0.3V to +12V
- OUT Short-Circuit Duration: Continuous
- Maximum Current Into Any Pin (except IN and OUT): ±50mA
- Continuous Power Dissipation (T_A = +70°C): TDFN (derate 23.8mW/°C above +70°C) 1904mW, SO (derate 18.9mW/°C above +70°C) 1509.40mW
- Operating Temperature Range: -40°C to +125°C
- Junction Temperature: +150°C
- Storage Temperature Range: -65°C to +150°C
- Lead Temperature (soldering, 10s): +300°C
- Soldering Temperature (reflow): +260°C

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Thermal Characteristics (Note 1)

- Junction-to-Ambient Thermal Resistance (θ_JA): 42°C/W (TDFN) derate 23.8mW/°C above +70°C, 1904mW
- Junction-to-Case Thermal Resistance (θ_JC): 9°C/W (SO) derate 18.9mW/°C above +70°C, 1509.40mW

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Note 2: Limits at T_A = -40°C are guaranteed by design.
Note 3: Output voltage regulation is guaranteed for I_{OUT} ≥ 5μA.
Note 4: Dropout voltage is defined as (V_{IN} - V_{OUT}) when V_{OUT} is 2% below the value of V_{OUT} when V_{IN} = V_{OUT} + 3V.
Note 5: For V_{OUT} = 3.3V, the 700mV dropout indicates V_{OUT} does not reach 2% below V_{OUT} at V_{IN} = V_{OUT} + 3V at minimum 4V input voltage.
Note 6: Enable to regulation time is the time the output takes to reach 95% of its final value with V_{IN} = 14V and EN is taken from V_{IL} to V_{IH} in 5ns.

IN: Regulator Supply Input. Supply voltage ranges from 4V to 40V. Bypass with a 0.1µF capacitor to GND.

GND: Ground

OUT: Regulator Output. Bypass OUT to GND with a low-ESR capacitor with a minimum 2.2µF.

FB: Feedback Regulation Set-Point. Connect an external resistive divider network from OUT to FB to GND to adjust the output voltage from 1.8V to 10V.

EN: Active-High Enable Input. Force EN high (or connect to $V_{IN}$) to turn the regulator on. Pull EN low (or leave unconnected) to place the device in a low-power shutdown mode. EN is internally pulled down to GND through a 0.5µA sink current.

Functional Diagrams

**Figure 1. MAX15006 Simplified Functional Diagram**

**Figure 2. MAX15007 Simplified Functional Diagram**
Detailed Description
The MAX15006/MAX15007 high-voltage linear regulators operate over a 4V to 40V input voltage range. These devices guarantee 50mA load drive, and offer preset output voltages of +3.3V (MAX15006A/MAX15007A) or +5V (MAX15006B/MAX15007B) or an adjustable voltage output from 1.8V to 10V (MAX15006C/MAX15007C). Thermal shutdown and short-circuit protection prevent damage during overtemperature and overcurrent conditions. The MAX15007 includes an enable input (EN) allowing the regulators to be turned on/off using a logic-level voltage. Driving EN high turns on the device while driving EN low places the device in a low-power shutdown mode. In shutdown, the device consumes only 3μA (typ). EN withstands voltages up to 40V, allowing it to be driven by high input level voltages or connected to IN for always-on operation.

Thermal Protection
When the junction temperature exceeds +165°C, an internal thermal sensor turns the pass transistor off, and allows the device to cool. The thermal sensor turns the pass transistor on again after the junction temperature cools by 20°C. This results in a cycled output during continuous thermal-overload conditions. Thermal protection protects the MAX15006/MAX15007 in the event of fault conditions. Operation at TJ = +150°C without going into thermal shutdown is not guaranteed. Use Figures 3a and 3b to determine the minimum guaranteed output current.

Output Short-Circuit Current Limit
The MAX15006/MAX15007 feature a 175mA current limit. The output can be shorted to GND for an indefinite period of time without damage to the device. During a short circuit, the power dissipated across the pass transistor can quickly heat the device. When the die temperature reaches +165°C, the MAX15006/MAX15007 shut down and automatically restart after the die temperature cools by 20°C.
Applications Information

Output Voltage Setting

The MAX15006C/MAX15007C provide an adjustable output voltage from 1.8V to 10V and do not operate in a preset output voltage mode. Connect an external resistive divider from OUT to FB to GND as shown in Figure 4 to set the desired output voltage. \( V_{\text{OUT}} \) is calculated as follows:

\[
V_{\text{OUT}} = V_{\text{FB}} \times \left(1 + \frac{R1}{R2}\right)
\]

where \( V_{\text{FB}} = 1.23V \) and a 5\( \mu \)A minimum current is required in the external divider for stability.

Available Output Current Calculation

The MAX15006/MAX15007 provide up to 50mA of continuous output current. The input voltage range extends to 40V. Package power dissipation limits the amount of output current available for a given input/output voltage and ambient temperature. Figure 5 shows the maximum allowable power dissipation for these devices to keep the junction temperature below +150°C. Figure 5 assumes that the exposed metal pad of the MAX15006/MAX15007 is soldered to 1\( \text{in}^2 \) of PCB copper.

Use Figure 5 to determine the allowable package dissipation for a given ambient temperature. Alternately, use the following formulas to calculate the allowable package dissipation. For the TDFN package:

\[
P_D = \begin{cases} 
1.9048W & \text{for } T_A \leq +70^\circ C \\
1.9048W - 0.0238 \frac{W}{^\circ C} (T_A - 70^\circ C) & \text{for } +70^\circ C < T_A \leq +125^\circ C 
\end{cases}
\]

For the SO-EP package:

\[
P_D = \begin{cases} 
1.8605W & \text{for } T_A \leq +70^\circ C \\
1.8605W - 0.0233 \frac{W}{^\circ C} (T_A - 70^\circ C) & \text{for } +70^\circ C < T_A \leq +125^\circ C 
\end{cases}
\]

After determining the allowable package dissipation, calculate the maximum allowable output current, without exceeding the +150°C junction temperature, using the following formula:

\[
I_{\text{OUT (MAX)}} = \frac{P_D}{V_{\text{IN}} - V_{\text{OUT}}} \leq 50mA
\]

The above equations do not include the negligible power dissipation from self-heating due to the IC ground current.

Example 1 (TDFN Package):

\[
T_A = +125^\circ C \\
V_{\text{IN}} = 26V \\
V_{\text{OUT}} = 3.3V
\]

Calculate the maximum allowable package dissipation at the given temperature as follows:

\[
P_D = 1.9048W - 0.0238 \frac{W}{^\circ C} (125^\circ C - 70^\circ C) = 595.8mW
\]

And establish the maximum output current:

\[
I_{\text{OUT (MAX)}} = \frac{595.8mW}{26V - 3.3V} = 26.2mA
\]

Figure 4. Setting the Adjustable Output Voltage

Figure 5. Calculated Maximum Power Dissipation vs. Ambient Temperature
Example 2 (TDFN Package):
\[ T_A = +85^\circ C \]
\[ V_{IN} = 14V \]
\[ V_{OUT} = 5V \]
Calculate the maximum allowable package dissipation at the given temperature as follows:
\[ P_D = 1.9048W - 0.0238 \frac{W}{^\circ C}(85^\circ C - 70^\circ C) = 1.5478W \]
Then determine the maximum output current:
\[ I_{OUT(\text{MAX})} = \frac{1.5478W}{14V - 5V} = 172mA \Rightarrow I_{OUT(\text{MAX})} = 50mA \]

Example 3 (TDFN Package):
\[ T_A = +50^\circ C \]
\[ V_{IN} = 9V \]
\[ V_{OUT} = 5V \]
Calculate the maximum allowable package dissipation at the given temperature as follows:
\[ P_D = 1.9048W \]
Find the maximum output current:
\[ I_{OUT(\text{MAX})} = \frac{1.9048W}{9V - 5V} = 476mA \Rightarrow I_{OUT(\text{MAX})} = 50mA \]

In Examples 2 and 3, the maximum output current is calculated as 172mA and 476mA, respectively; however, the allowable output current cannot exceed 50mA.

Alternately, use Figures 6a and 6b to quickly determine the maximum allowable output current for selected ambient temperatures and input voltages.

**Output-Capacitor Selection and Regulator Stability**
For stable operation over the full temperature range and with load currents up to 50mA, use a low-ESR 2.2μF (min) ceramic or tantalum output capacitor. Use larger output-capacitor values such as 22μF to reduce noise, improve load-transient response, and power-supply rejection.

Some ceramic dielectrics exhibit large capacitance and ESR variations with temperature. Ensure the minimum capacitance under worst-case conditions does not drop below 1.3μF to ensure output stability. With an X7R dielectric, 2.2μF should be sufficient at all operating temperatures.

* Denotes a lead(Pb)-free/RoHS-compliant package.
/ V denotes an automotive qualified part.
*EP = Exposed pad.

### Chip Information

**PROCESS:** BiCMOS

### Package Information

For the latest package outline information and land patterns (footprints), go to [www.maximintegrated.com/packages](http://www.maximintegrated.com/packages). Note that a “+”, “#”, or “-” in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.
