**General Description**

The MAX16910 ultra-low quiescent current, high-voltage linear regulator is ideal for use in automotive and battery-operated systems. The device operates from a +3.5V to +30V input voltage, delivers up to 200mA of load current, and consumes only 20µA of quiescent current at no load. The device consumes only 1.6µA current when in shutdown. The input is +45V transient tolerant and is designed to operate under load-dump conditions. The MAX16910 can be configured as either fixed output voltage (+3.3V or +5V) or adjustable output voltage using an external resistive divider.

The MAX16910 features an open-drain, active-low **RESET** output with fixed thresholds offered at 92.5% and 87.5% of the output voltage. The **RESET** output remains low for a fixed period of 60µs after the output voltage exceeds its threshold. The **RESET** delay can be extended with an external capacitor.

The MAX16910 includes an enable input, short-circuit protection, and thermal shutdown. The MAX16910 operates over the -40°C to +125°C automotive temperature range. The device is available in a space-saving, thermally enhanced, 3mm x 3mm, 8-pin TDFN package and 5mm x 4mm, 8-pin SO package.

**Applications**

- Automotive
- Industrial
- Telecom

**Benefits and Features**

- Enables System Designers to Meet Stringent Module Requirements for 100µA Quiescent Current
  - Low 20µA Quiescent Current
  - Up to 200mA Output-Current Capability
  - User-Selectable Output Voltage (+3.3V or +5V Fixed and +1.5V to +11V Adjustable with External Resistive Divider)
- Tiny Output Capacitors Reduce Board Space and BOM Cost
  - Stable Operation with 4.7µF Output Capacitor
- Accurate **RESET** Output with Adjustable Delay Eliminates Need for Separate Reset IC
  - Open-Drain **RESET** Output with Adjustable Delay
  - Fixed-Reset Threshold Options: 87.5% or 92.5%
- Operates Through Cold-Crank Conditions
  - Low-Dropout Voltage of 280mV at 200mA
  - +3.5V to +30V Wide Input Voltage Range, +45V Tolerant
- Robust Performance in Automotive Environment
  - Thermal and Short-Circuit Protection
  - High-Voltage Enable Input (+45V)
  - Operating -40°C to +125°C Temperature Range
  - Automotive Qualified

**Applications**

- Automotive
- Industrial
- Telecom

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Detailed Description

The MAX16910 low-quiescent current, high-voltage linear regulator is ideal for use in automotive and battery-operated systems. The device operates from an input voltage of +3.5V to +30V, delivers up to 200mA of load current, and consumes only 20µA of quiescent current at no load. The input is +45V tolerant and is designed to operate under load-dump conditions. The MAX16910 can be user configured as either a fixed output voltage (+3.3V or +5V) or an adjustable output voltage using an external resistive divider.

The MAX16910 features an open-drain, active-low RESET output with fixed thresholds at 92.5% and 87.5% of the output voltage. The RESET output remains low for a fixed period of 60µs after the output voltage exceeds its threshold. The RESET delay can be extended with an external capacitor. The MAX16910 includes an enable input short-circuit protection and thermal shutdown.

Fixed Output-Voltage Mode

The SET and SETOV inputs determine the output mode. For the 5V fixed output-voltage mode (see the 5V fixed output circuit in the Typical Operating Circuits), connect SET to GND and SETOV to OUT. Place a 10kΩ resistor between SETOV and OUT if expecting line transients faster than 0.03V/µs. For the 3.3V fixed output-voltage mode (see the 3.3V fixed output circuit in the Typical Operating Circuits) connect SET to GND and SETOV to GND.

Adjustable Output-Voltage Mode

For the adjustable output-voltage mode (see the adjustable output circuit in the Typical Operating Circuits), connect SET to IN or a voltage > 2.4V and connect SETOV to a resistive divider R1 and R2 between OUT and GND. An output voltage between 1.5V and 11V can be selected using the following equation:

\[ V_{OUT} = V_{SETOV} \times \left(1 + \frac{R1}{R2}\right) \]

where \( V_{SETOV} = 1.25V \) and \( R2 \) should be less than or equal to 100kΩ.
ENABLE
ENABLE is an active-high, logic-level enable input that turns the device on or off. Drive ENABLE high to turn the device on. An internal 0.65µA pulldown current keeps the MAX16910 in shutdown mode when driven by a three-state driver in high-impedance mode, or an open-drain driver. When in shutdown, the MAX16910 consumes only 1.6µA. ENABLE withstands voltages up to 45V, allowing it to be driven by high-input level voltages or connected to IN for always-on operation.

Thermal Protection
The MAX16910 features thermal protection. When the junction temperature exceeds +180°C, an internal thermal sensor turns off the pass transistor, and allows the device to cool. The thermal sensor turns on the pass transistor again after the junction temperature cools by 25°C. This results in a cycled output during continuous thermal-overload conditions. Thermal protection protects the MAX16910 in the event of fault conditions. For continuous operation, do not exceed the absolute maximum junction temperature rating of +150°C.

Output Short-Circuit Current Limit
The MAX16910 features a 330mA current limit. The output can be shorted to GND continuously without damage to the device. During a short circuit, the power dissipated across the pass transistor can quickly heat the device. When the die temperature reaches +180°C, the MAX16910 turns off the pass transistor and automatically restarts after the die temperature has cooled by 25°C.

RESET Output
The MAX16910 features an active-low, open-drain reset output. Once the monitored output voltage exceeds the reset threshold voltage, RESET remains low for the reset timeout period and then goes high. RESET changes from high to low whenever the monitored output voltage drops below the reset threshold voltage. RESET also asserts low when ENABLE is low and during thermal shutdown.

Timeout
The MAX16910 features a reset timeout period adjustable input. The internal capacitance produces a 60µs default delay when TIMEOUT is left unconnected. Connect a capacitor from TIMEOUT to GND to set a higher timeout period than default. Use the following formula to determine the reset timeout capacitor:

$$C_{\text{TIMEOUT}} = 0.8 \times I_{\text{TO}} \times T_{\text{TIMEOUT}}$$

where $C_{\text{TIMEOUT}}$ is in nF, $I_{\text{TO}}$ is in µA, and $T_{\text{TIMEOUT}}$ is in ms.

For example, if $I_{\text{TO}}$ is 1µA, $C_{\text{TIMEOUT}}$ needs to be 8nF to get a 10ms delay.

Applications Information

Output-Capacitor Selection and Regulator Stability
For stable operation over the full temperature range, with fixed 3.3V and 5.0V output voltages, use a low-ESR 4.7µF capacitor. For resistor-programmed output voltages, a 10µF low-ESR ceramic capacitor is recommended for stable operation. Use larger output-capacitor values such as 22µF to reduce noise, improve load-transient response and power-supply rejection. Some ceramic dielectrics exhibit large capacitance and ESR variations with temperature. To improve power-supply rejection and transient response, use a capacitor larger than the minimum 1µF capacitor between IN and GND.

Available Output-Current Calculation
The MAX16910 provides up to 200mA of continuous output current. The input voltage range extends to 30V. Package power dissipation limits the amount of output current available for a given input/output voltage and ambient temperature. Figure 1 shows the maximum allowable power dissipation for these devices to keep the junction temperature below +150°C. Figure 1 assumes that the exposed metal pad of the MAX16910 is soldered to a 1in² of multilayer copper board. Use Figure 1 to determine the allowable package dissipation for a given ambient temperature. Alternately, use the following formulas to calculate the allowable power dissipation $P_D$.

For the TDFN-EP package:

$$P_D = \begin{cases} 1.951W & \text{for } T_A \leq +70°C \\ 1.951W - 0.0244 \frac{W}{°C} \times (T_A - 70°C) & \text{for } +70°C \leq T_A < +125°C \end{cases}$$

For the SO-EP package:

$$P_D = \begin{cases} 1.861W & \text{for } T_A \leq +70°C \\ 1.861W - 0.0232 \frac{W}{°C} \times (T_A - 70°C) & \text{for } +70°C \leq T_A < +125°C \end{cases}$$

www.maximintegrated.com
After determining the allowable power dissipation, calculate the maximum allowable output current, without exceeding the +150°C junction temperature, using the following formula:

\[
I_{\text{OUT(MAX)}} = \frac{P_D}{V_{\text{IN}} - V_{\text{OUT}}}
\]

The above equations do not include the negligible power dissipation from self-heating due to the device ground current.

**Example 1 (TDFN-EP Package):**

\[T_A = +125^\circ C, \ V_{\text{IN}} = 16V, \ V_{\text{OUT}} = 3.3V\]

Calculate the maximum allowable power dissipation at the given temperature as follows:

\[P_D = 1.951W - 0.0244\ \frac{W}{^\circ C} \times (125^\circ C - 70^\circ C) = 609mW\]

And establish the maximum output current:

\[I_{\text{OUT(MAX)}} = \frac{609mW}{16V - 3.3V} \approx 48mA\]

**Example 2 (TDFN-EP Package):**

\[T_A = +50^\circ C, \ V_{\text{IN}} = 9V, \ V_{\text{OUT}} = 5V\]

Calculate the maximum allowable power dissipation at the given temperature as follows:

\[P_D = 1.951W\]

Find the maximum output current:

\[I_{\text{OUT(MAX)}} = \frac{1.951W}{9V - 5V} = 488mA \Rightarrow I_{\text{OUT(MAX)}} = I_{\text{SC}} = 330mA \text{ (typ)}\]

In Example 2, the maximum output current is calculated as 488mA. The allowable output current cannot exceed the given internal current limit for the device of 330mA (typ).

**Selecting Timeout Capacitor**

The reset timeout period is adjustable to accommodate a variety of microprocessor applications. Adjust the reset timeout period by connecting a capacitor between TIMEOUT and GND.

\[t_{\text{RP}} = \frac{1.25 \times C_{\text{TIMEOUT}}}{I_{\text{TO}}^2}\]

where \(t_{\text{RP}}\) is in ms and \(C_{\text{TIMEOUT}}\) is in nF.

Leave TIMEOUT unconnected to select the internally fixed timeout period. \(C_{\text{TIMEOUT}}\) must be a low-leakage (< 10nA) type capacitor. Ceramic capacitors are recommended; do not use capacitor values lower than 100pF to avoid the influence of parasitic capacitances.

**Exposed Pad**

The MAX16910 package features an exposed thermal pad on its underside that should be used as a heatsink. This pad lowers the package’s thermal resistance by providing a direct heat-conduction path from the die to the PCB. Connect the exposed pad and GND to the system ground using a large pad or ground plane, or multiple vias to the ground plane layer.
