General Description

The MAX2754 self-contained, linear modulation, voltage-controlled oscillator (VCO) is intended for use in the 2.4GHz to 2.5GHz ISM band, particularly for FSK modulation systems that utilize a direct frequency-modulation transmit architecture. This device features a linear modulation input in addition to the standard frequency tuning input. The frequency tuning range of 1145MHz to 1250MHz (1/2 LO) also supports an IF up to 110MHz with low side LO. The VCO is based on Maxim’s proprietary monolithic VCO technology, where all VCO components are integrated on-chip, including the varactor and inductor.

The MAX2754 linear modulation input offers a means to directly FM modulate the VCO with a constant modulation sensitivity over the tuning voltage input range. Typical frequency deviation is -500kHz/V which is linear to ±4% of the guaranteed frequency limits. The tuning input voltage range is +0.4V to +2.4V and the oscillator frequency is factory adjusted to provide guaranteed limits. The oscillator signal is buffered by an output amplifier stage (internally matched to 50Ω) to provide higher output power and isolate the oscillator from load impedance variations.

The MAX2754 operates over a +2.7V to +5.5V supply range. This device also provides a digitally controlled shutdown mode to permit implementation of sophisticated power-supply management. In shutdown, the supply current is reduced to 0.2µA. Even when active, power consumption is a modest 41mW.

The MAX2754 is packaged in the miniature 8-pin µMAX to offer the world’s smallest, complete 2.4GHz direct-modulation VCO solution.

Features

- Fully Monolithic VCO Construction with On-Chip Inductor and Varactor Tuning Elements
- Guaranteed 1145MHz to 1250MHz Tuning Range to Support 1/2 LO Applications
- Modulation Linearity Within ±4%
- Precise Modulation Gain (-500kHz/V)
- Low Phase Noise (-137dBc/Hz at 4MHz offset)
- +2.7V to +5.5V Single-Supply Operation
- Low-Current Shutdown Mode
- Miniature 8-Pin µMAX® Package

Applications

- HomeRF WLAN
- Bluetooth
- 2.4GHz Cordless Phones
- 2.4GHz Wireless Data Radios

Pin Configuration

8-pin µMAX

(3mm x 5mm)

µMAX is a registered trademark of Maxim Integrated Circuits, Inc.

1.2GHz VCO with Linear Modulation Input

**ABSOLUTE MAXIMUM RATINGS**

Vcc to GND ..................................................-0.3V to +6.0V  
VREG to GND ...............................................-0.3V to +6.0V  
TUNE, SHDN, MOD to GND ..........-0.3V to (Vcc + 0.3V)  
OUT to GND ................................................-0.3V to +6.0V  
Continuous Power Dissipation (TA = +70°C)  
8-Pin µMAX (derate 5.7mW/°C above TA = +70°C) ....457mW  
Operating Temperature Range ..............-40°C to +85°C  
Junction Temperature .........................-150°C to +150°C  
Storage Temperature Range ..............-65°C to +160°C  
Lead Temperature (soldering, 10s) ..........-65°C to +300°C  

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**CAUTION! ESD SENSITIVE DEVICE**

**DC ELECTRICAL CHARACTERISTICS**

(Vcc = +2.7V to +5.5V, VTUNE = +0.4V to +2.4V, VSHDN ≥ +2.0V, VMOD = +1.4V, OUT is connected to a 50Ω load, TA = -40°C to +85°C. Typical values are at VCC = +3.0V, TA = +25°C, unless otherwise noted.) (Note 1)

Note 1: Specifications are production tested at TA = +25°C. Limits over temperature are guaranteed by design and characterization.

Note 2: Limits are guaranteed by production test at +25°C.

Note 3: Center point is nominally +1.4V.

Note 4: Maximum variation in the modulation sensitivity from its average value over the guaranteed frequency limits.

Note 5: Bandwidth is defined as the point where the response to the modulation port is 0.707 times the low-frequency response. Bandwidth limits on the modulation input for a 1Vp-p sine wave. Common-mode VMOD = +1.4V.

Note 6: Refer to Output Buffer section for suggestions to improve the return loss to 12dB.

Note 7: Turn-on time to within 3dB of final output power.

Note 8: Turn-off time to output power of -10dBm.
1.2GHz VCO with Linear Modulation Input

Typical Operating Characteristics

(MAX2754 EV kit, \(V_{CC} = +3.0V\), \(V_{SHDN} \geq +2.0V\), \(V_{TUNE} = V_{MOD} = +1.4V\), and \(T_A = +25\degree C\), unless otherwise noted.)
**Detailed Description**

**Oscillator**

The MAX2754 VCO is implemented as an LC oscillator topology, integrating all of the tank components on-chip. This fully monolithic approach provides an extremely easy-to-use VCO, equivalent to a VCO module. The frequency is controlled by a voltage applied to the TUNE pin. The VCO core uses a differential topology to provide a stable frequency versus supply voltage and improve the immunity to load variations. In addition, there is a buffer amplifier following the oscillator core to provide added isolation from load and supply variations and to boost the output power.

**Linear Modulation**

The linear modulation input offers a means to directly FM modulate the VCO with a controlled amount of frequency deviation for a given input voltage deviation. The unique technique maintains a consistent modulation gain (df/dVMOD) across the entire frequency tuning range of the part, enabling accurate FM modulation derived solely from the filtered NRZ “data” stream (the modulation voltage input).

The modulation input is single-ended and centered about +1.4V. The linear modulation full-scale range is ±1V around this point, for a +0.4V to +2.4V input voltage range. A very important point to note is that the sign of the modulation gain is negative. A positive change in VMOD results in a negative change in oscillation frequency. This convention for the modulation gain is due to the practical implementation of the internal linearizing circuitry. This gain inversion must be considered when designing the analog voltage interface that drives the linear modulation input. The easiest way to handle this is to invert the logic polarity of the modulation data three-state output buffer (TX data output). Where it is impossible to invert the data-stream logic polarity, an external inverter and three-state buffer would be required. These devices are offered in small single-logic gates in SC-79 style packages from various manufacturers (e.g., Fairchild—Tiny Logic, On Semiconductor, or Rohm).

Figure 1 illustrates the frequency versus VMOD characteristic of the modulation input. Note the negative slope of the curve, dfMOD/dVMOD < 0, where fMOD = fOUT - fNOM.

**Output Buffer**

The oscillator signal from the core drives an output buffer amplifier. The amplifier is internally matched to 50Ω including an on-chip DC-blocking capacitor. The return loss can be improved to a minimum of 12dB over 1145MHz to 1250MHz by adding a 2.5nH series inductor and a 3.0pF shunt capacitor. The output buffer has a ground connection separate from the oscillator core to minimize load-pulling effects. The amplifier boosts the oscillator signal to a level suitable for driving most RF mixers.
1.2GHz VCO with Linear Modulation Input

Applications Information

Tune Input
The tuning input is typically connected to the output of the PLL loop filter. The loop filter provides an appropriately low-impedance source. Incorporate an extra RC filter stage to reduce high-frequency noise and spurious signals. Any excess noise on the tuning input is directly translated into FM noise, which can degrade the phase-noise performance of the oscillator. Therefore, it is important to minimize the noise introduced on the tuning input. A simple RC filter with low corner frequency is needed during testing to filter the noise present on the voltage source driving the tuning line.

Two-Level FSK Applications
The MAX2754 is designed for use in FSK applications operating in the 2.4GHz to 2.5GHz ISM band. Specifically, it is targeted for those systems which utilize a direct TX modulation architecture in which the VCO is directly modulated with the data signal during the transmit (TX) mode. The VCO in these systems runs at half the RF output frequency and is used in conjunction with a frequency doubler to produce the final LO signal for both RX and TX modes of operation.

Figure 1 shows the modulation frequency deviations characteristics.

Figure 2 shows a typical applications circuit. To compute R1, R2, R3, and R4, determine the modulation voltage center point (V_{MOD} = +1.4V). Compute the required modulation voltage deviation as follows:

- For linear modulation, use Equation 1.2GHz VCO with Linear Modulation Input

**Figure 2. Typical Application Circuit for Two-Level FSK**
ΔV = Δf / 500kHz/V (nominal modulation sensitivity)

Let R = R1 + R3 + R4. Setting R based on the desired current from VCC and filter impedance level:

\[
R1 = \frac{R}{2}, \\
R2 = \left( \frac{\text{VMODB}}{\Delta V} - 1 \right) \times \frac{R}{4}, \\
R3 = R \times \left( \frac{1}{2} - \frac{\text{VMODB}}{V_{CC}} \right), \\
R4 = \frac{\text{VMODB}}{V_{CC}} \times R
\]

**1.2GHz VCO with Linear Modulation Input**

**Layout Issues**

Use controlled impedance lines (microstrip, co-planar waveguide, etc.) each time for high-frequency signals. Always place decoupling capacitors as close to the VCC pins as possible; for long VCC lines, it may be necessary to add additional decoupling capacitors located further from the device. Always provide a low-inductance path to ground, and keep GND vias as close to the device as possible. Thermal reliefs on GND pads are not recommended.

1.2GHz VCO with Linear Modulation Input

Package Information

(The package drawing(s) in this data sheet may not reflect the most current specifications. For the latest package outline information go to www.maxim-ic.com/packages.)

Notes:
1. D&E do not include mold flash.
2. Mold flash or protrusions not to exceed 0.15mm (.006").
4. Meets JEDEC MO-187C-AA.
