General Description

The MAX3737 is a 3.3V laser driver designed for multirate transceiver modules with data rates from 155Mbps to 2.7Gbps. Lasers can be DC-coupled to the MAX3737 for reduced component count and ease of multirate operation.

Laser extinction ratio control (ERC) combines the features of automatic power control (APC), modulation compensation, and built-in thermal compensation. The APC loop maintains constant average optical power. Modulation compensation increases the modulation current in proportion to the bias current. These control loops combined with thermal compensation maintain a constant optical extinction ratio over temperature and lifetime.

The MAX3737 accepts differential data input signals. The wide 5mA to 60mA (up to 85mA AC-coupled) modulation current range and up to 100mA bias current range makes the MAX3737 ideal for driving FP/DFB lasers in fiber-optic modules. External resistors set the required laser current levels. The MAX3737 provides transmit disable control (TX_DISABLE), single-point fault tolerance, bias-current monitoring, modulation-current monitoring, and photocurrent monitoring. The device also offers a latched failure output (TX_FAULT) to indicate faults, such as when the APC loop is no longer able to maintain the average optical power at the required level. The MAX3737 is compliant with the SFF-8472 transmitter diagnostic and SFP MSA timing requirements.

The MAX3737 is offered in a 5mm x 5mm 32-pin thin QFN and QFN package and operates over the -40°C to +85°C extended temperature range.

Applications

Multirate OC-3 to OC-48 FEC Transceivers
Gigabit Ethernet SFF/SFP and GBIC Transceivers
1Gbps/2Gbps Fibre Channel SFF/SFP and GBIC Transceivers

Features

♦ Single 3.3V Power Supply
♦ 47mA Power-Supply Current
♦ 85mA Modulation Current
♦ 100mA Bias Current
♦ Automatic Power Control (APC)
♦ Modulation Compensation
♦ On-Chip Temperature Compensation
♦ Self-Biased Inputs for AC-Coupling
♦ Ground-Referenced Current Monitors
♦ Laser Safety, Shutdown, and Alarm Outputs

# Multirate Laser Driver with Extinction Ratio Control

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage $V_{CC}$: $-0.5\text{V}$ to $+6.0\text{V}$

IN+, IN-, TX_DISABLE, TX_FAULT, SHUTDOWN, MC_MON, BC_MON, PC_MON, VBS, VMD, APCFILT1, APCFILT2, MD, TH_TEMP, MODTCOMP, MODBCOMP, MODSET, and APCSET Voltage: $-0.5\text{V}$ to $V_{CC} + 0.5\text{V}$

OUT+, OUT-, BIAS Current: $-20\text{mA}$ to $+150\text{mA}$

Continuous Power Dissipation ($T_A = +85\degree\text{C}$)

QFN/TQFN (derate $21.2\text{mW/°C}$ above $+85\degree\text{C}$).........1.3W

Operating Junction Temperature Range...........$-55\degree\text{C}$ to $+150\degree\text{C}$

Storage Temperature Range .........................$-55\degree\text{C}$ to $+150\degree\text{C}$

Lead Temperature (soldering, 10s)......................$+300\degree\text{C}$

Soldering Temperature (reflow) .........................$+260\degree\text{C}$

Leads(Pb)-free.....................................................$+240\degree\text{C}$

Containing lead(Pb)..............................................$+240\degree\text{C}$

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

($V_{CC} = 2.97\text{V}$ to $3.63\text{V}$, $T_A = -40\degree\text{C}$ to $+85\degree\text{C}$. Typical values are at $V_{CC} = 3.3\text{V}$, $I_{BIAS} = 60\text{mA}$, $I_{MOD} = 60\text{mA}$, $T_A = +25\degree\text{C}$, unless otherwise noted.) (Notes 1, 2)

  - Conditions: 2.0 V

- **TX_DISABLE Input Low**
  - V_LO
  - Conditions: 0.8 V

- **TX_DISABLE Input Current**
  - Conditions: V_HI = VCC, V_LO = GND
  - Conditions: -450 μA, -800 μA

- **TX_FAULT Output Low**
  - Sinking 1mA, open collector
  - Conditions: 0.4 V

- **Shutdown Output High**
  - sourcing 100μA
  - Conditions: VCC - 0.4 V

- **Shutdown Output Low**
  - Sinking 100μA
  - Conditions: 0.4 V

Note 1: AC characterization is performed using the circuit in Figure 2 using a PRBS 2^23 - 1 or equivalent test pattern.

Note 2: Specifications at -40°C are guaranteed by design and characterization.

Note 3: Excluding IBIAS and IMOD. Input data is AC-coupled. TX_FAULT open, SHUTDOWN open.

Note 4: Power-supply noise rejection (PSNR) = 20log10(V_noise on VCC/VOUT). VOUT is the voltage across the 15Ω load when IN+ is high.

Note 5: The minimum required voltage at the OUT+ and OUT- pins is +0.75V.

Note 6: Guaranteed by design and characterization.

Note 7: Tested with 00001111 pattern at 2.7Gbps.

Note 8: DJ includes pulse-width distortion (PWD).

Multirate Laser Driver with Extinction Ratio Control

Detailed Description

The MAX3737 laser driver consists of three main parts: a high-speed modulation driver, biasing block with ERC, and safety circuitry. The circuit design is optimized for high-speed, low-voltage (3.3V) operation (Figure 4).

High-Speed Modulation Driver

The output stage is composed of a high-speed differential pair and a programmable modulation current source. The MAX3737 is optimized for driving a 15Ω load. The minimum instantaneous voltage required at OUT+ is 0.7V for modulation current up to 60mA and 0.75V for currents from 60mA to 85mA. Operation above 60mA can be accomplished by AC-coupling or with sufficient voltage at the laser to meet the driver output voltage requirement.

To interface with the laser diode, a damping resistor (R_d) is required. The combined resistance due to the series damping resistor and the equivalent series resistance (ESR) of the laser diode should equal 15Ω. To further damp aberrations caused by laser diode parasitic inductance, an RC shunt network may be necessary. Refer to Application Note 274: HFAN-02.0: Interfacing Maxim Laser Drivers with Laser Diodes for more information.

At data rates of 2.7Gbps, any capacitive load at the cathode of a laser diode degrades optical output performance. Because the BIAS output is directly connected to the laser cathode, minimize the parasitic capacitance associated with the pin by using an inductor to isolate the BIAS pin parasitics from the laser cathode.

Extinction Ratio Control

The extinction ratio (r_e) is the laser on-state power divided by the off-state power. Extinction ratio remains constant if peak-to-peak and average power are held constant:

\[
    r_e = \frac{2P_{AVG} + P_{p-p}}{2P_{AVG} - P_{p-p}}
\]

Average power is regulated using APC, which keeps constant current from a photodiode coupled to the laser. Peak-to-peak power is maintained by compensating the modulation current for reduced slope efficiency (\(\eta\)) of the laser over time and temperature:

\[
    P_{AVG} = \frac{I_{MD}}{P_{MON}}
\]

\[
    P_{p-p} = \eta \times I_{MOD}
\]
Modulation compensation from bias increases the modulation current by a user-selected proportion (K) needed to maintain peak-to-peak laser power as bias current increases with temperature. Refer to Maxim Application Note 1119: HFAN-02.2.1: Maximizing the Extinction Ratio of Optical Transmitters Using K-Factor Control for details:

\[ K = \frac{\Delta I_{MOD}}{\Delta I_{BIAS}} \]

This provides a first-order approximation of the current increase needed to maintain peak-to-peak power. Slope efficiency decreases more rapidly as temperature increases. The MAX3737 provides additional temperature compensation as temperature increases past a user-defined threshold (TTH).

Safety Circuitry

The safety circuitry contains a disable, input (TX_DISABLE), a latched fault output (TX_FAULT), and fault detectors (Figure 5). This circuitry monitors the operation of the laser driver and forces a shutdown if a fault is detected (Table 1). The TX_FAULT pin should be pulled high with a 4.7kΩ to 10kΩ resistor to VCC as required by the SFP MSA. A single-point fault can be a short to VCC or GND. See Table 2 to view the circuit response to various single-point failures. The transmit fault condition is latched until reset by a toggle of TX_DISABLE or VCC. The laser driver offers redundant laser diode shutdown through the optional shutdown circuitry as shown in the Typical Operating Circuit. This shutdown transistor prevents a single-point fault at the laser from creating an unsafe condition.

**Multirate Laser Driver with Extinction Ratio Control**

</table>

*A fault state asserts the TX_FAULT pin, disables the modulation and bias currents, and asserts the SHUTDOWN pin.*

### Table 2. Circuit Responses to Various Single-Point Faults

Safety Circuitry Current Monitors

The MAX3737 features monitors (MC_MON, BC_MON, PC_MON) for modulation current (\( I_{MOD} \)), bias current (\( I_{BIAS} \)), and photocurrent (\( I_{MD} \)). The monitors are realized by mirroring a fraction of the currents and developing voltages across external resistors connected to ground. Voltages greater than \( V_{REF} \) at MC_MON, PC_MON, or BC_MON result in a fault state. For example, connecting a
Multirate Laser Driver with Extinction Ratio Control

100Ω resistor to ground at each monitor output gives the following relationships:

\[
\begin{align*}
V_{MC\_MON} &= (IMOD / 268) \times 100\Omega \\
V_{BC\_MON} &= (IBIAS / 82) \times 100\Omega \\
V_{PC\_MON} &= IMD \times 100\Omega
\end{align*}
\]

External sense resistors can be used for high-accuracy measurement of bias and photodiode currents. On-chip isolation resistors are included to reduce the number of components needed to implement this function.

**Design Procedure**

When designing a laser transmitter, the optical output is usually expressed in terms of average power and extinction ratio. Table 3 gives relationships that are helpful in converting between the optical average power and the modulation current. These relationships are valid if the mark density and duty cycle of the optical waveform are 50%.

For a desired laser average optical power (\(P_{AVG}\)) and optical extinction ratio (\(r_e\)), the required bias and modulation currents can be calculated using the equations in Table 3. Proper setting of these currents requires knowledge of the laser to monitor transfer (\(\rho_{MON}\)) and slope efficiency (\(\eta\)).

**Programming the Monitor Diode Current Set Point**

The MAX3737 operates in APC mode at all times. The bias current is automatically set so average laser power is determined by the APCSET resistor:

\[
P_{AVG} = \frac{IMD}{\rho_{MON}}
\]

The APCSET pin controls the set point for the monitor-diode current. An internal current regulator establishes the APCSET current in the same manner as the MODSET pin. See the \(IMD\) vs. \(R_{APCSET}\) graph in the Typical Operating Characteristics and select the value of \(R_{APCSET}\) that corresponds to the required current at +25°C:

\[
IMD = \frac{1}{2} \times \frac{V_{REF}}{R_{APCSET}}
\]

The laser driver automatically adjusts the bias to maintain the constant average power. For DC-coupled laser diodes:

\[
I_{AVG} = I_{BIAS} + \frac{IMD}{2}
\]

**Programming the Modulation Current with Compensation**

Determine the modulation current from the laser slope efficiency:

\[
IMD = 2 \times \frac{P_{AVG}}{\eta} \times \frac{r_e - 1}{r_e + 1}
\]

The modulation current of the MAX3737 consists of a static modulation current (\(IMODS\)), a current proportional to \(IBIAS\), and a current proportional to temperature. The portion of \(IMOD\) set by MODSET is established by an internal current regulator, which maintains the reference voltage of \(V_{REF}\) across the external programming resistor. See to the \(IMOD\) vs. \(RMODSET\) graph in the Typical Operating Characteristics and select the value of \(RMODSET\) that corresponds to the required current at +25°C:

\[
I_{MOD} = \frac{P_{AVG}}{\eta} \times \frac{r_e - 1}{r_e + 1}
\]

*Note: Assuming a 50% average input duty cycle and mark density.*
**Multirate Laser Driver with Extinction Ratio Control**

\[ I_{\text{MOD}} = I_{\text{MODS}} + K \times I_{\text{BIAS}} + I_{\text{MODT}} \]
\[ I_{\text{MODS}} = 268 \times \frac{V_{\text{REF}}}{R_{\text{MODSET}}} \]
\[ I_{\text{MODT}} = TC \times (T - T_{TH}) \quad I \geq T_{TH} \]
\[ I_{\text{MODT}} = 0 \quad I < T_{TH} \]

An external resistor at the MODBCOMP pin sets current proportional to \( I_{\text{BIAS}} \). Open circuiting the MODBCOMP pin can turn off the interaction between \( I_{\text{BIAS}} \) and \( I_{\text{MOD}} \):

\[ K = \frac{1700}{1000 + R_{\text{MODBCOMP}}} \pm 10\% \]

If \( I_{\text{MOD}} \) must be increased from \( I_{\text{MOD1}} \) to \( I_{\text{MOD2}} \) to maintain the extinction ratio at elevated temperature, the required compensation factor is:

\[ K = \frac{I_{\text{MOD2}} - I_{\text{MOD1}}}{I_{\text{BIAS2}} - I_{\text{BIAS1}}} \]

A threshold for additional temperature compensation can be set with a programming resistor at the TH_TEMP pin:

\[ T_{TH} = -70^\circ C + \frac{1.45M\Omega}{9.2k\Omega + R_{\text{TH TEMP}}} \pm 10\% \]

The temperature coefficient of thermal compensation above \( T_{TH} \) is set by \( R_{\text{MODTCOMP}} \). Leaving the MODT-COMP pin open disables additional thermal compensation:

\[ TC = \frac{1}{0.5 + R_{\text{MODTCOMP}}(k\Omega)} \pm 10\% \]

**Current Compliance (\( I_{\text{MOD}} \leq 60\text{mA} \)), DC-Coupled**

The minimum voltage at the OUT+ and OUT- pins is 0.7V.

For:

\[ V_{\text{DIODE}} - \text{Diode bias point voltage (1.2V typ)} \]
\[ R_L - \text{Diode bias point resistance (5Ω typ)} \]
\[ R_D - \text{Series matching resistor (20Ω typ)} \]

For compliance:

\[ V_{\text{OUT+}} = V_{\text{CC}} - V_{\text{DIODE}} - I_{\text{MOD}} \times (R_D + R_L) - I_{\text{BIAS}} \times R_L \geq 0.7V \]

**Current Compliance (\( I_{\text{MOD}} > 60\text{mA} \)), AC-Coupled**

For applications requiring modulation current greater than 60mA, headroom is insufficient for proper operation of the laser driver if the laser is DC-coupled. To avoid this problem, the MAX3737’s modulation output can be AC-coupled to the cathode of a laser diode. An external pullup inductor is necessary to DC-bias the modulation output at \( V_{\text{CC}} \). Such a configuration isolates laser forward voltage from the output circuitry and allows the output at OUT+ to swing above and below the supply voltage (\( V_{\text{CC}} \)). When AC-coupled, the MAX3737 modulation current can be programmed up to 85mA. Refer to Application Note 274: HFAN-02.0: Interfacing Maxim Laser Drivers with Laser Diodes for more information on AC-coupling laser drivers to laser diodes.

For compliance:

\[ V_{\text{OUT+}} = V_{\text{CC}} - \frac{I_{\text{MOD}}}{2} \times (R_D + R_L) \geq 0.75V \]

**Determine \( C_{\text{APC}} \)**

The APC loop filter capacitor \( C_{\text{APC}} \) must be selected to balance the requirements for fast turn-on and minimal interaction with low frequencies in the data pattern. The low-frequency cutoff is:

\[ C_{\text{APC}}(\mu\text{F}) = \frac{68}{f_{\text{3DB}}(\text{kHz})} \times (\eta \times \rho_{\text{MON}})^{1.1} \]

High-frequency noise can be filtered with an additional cap \( C_{\text{MD}} \) from the MD pin to ground:

\[ C_{\text{MD}} = \frac{C_{\text{APC}}}{4} \]

The MAX3737 is designed so that turn-on time is faster than 1ms for most laser gain values (\( \eta \times \rho_{\text{MON}} \)). Choosing a smaller value of \( C_{\text{APC}} \) reduces turn-on time. Careful balance between turn-on time and low-frequency cutoff may be needed at low data rates for some values of laser gain.

**Interface Models**

Figures 6 and 7 show simplified input and output circuits for the MAX3737 laser driver. If dice are used, replace package parasitic elements with bondwire parasitic elements.
**Multirate Laser Driver with Extinction Ratio Control**

To minimize loss and crosstalk, keep the connections between the MAX3737 output and the laser diode as short as possible. Use good high-frequency layout techniques and multilayer boards with uninterrupted ground plane to minimize EMI and crosstalk. Circuit boards should be made using low-loss dielectrics. Use controlled-impedance lines for data inputs, as well as the module output.

**Laser Safety and IEC 825**

Using the MAX3737 laser driver alone does not ensure that a transmitter design is IEC 825 compliant. The entire transmitter circuit and component selections must be considered. Each customer must determine the level of fault tolerance required by their application, recognizing that Maxim products are not designed or authorized for use as components in systems intended for surgical implant into the body, for applications intended to support or sustain life, or for any other application where the failure of a Maxim product could create a situation where personal injury or death may occur.
**Exposed-Pad (EP) Package**

The exposed-pad on the 32-pin QFN provides a very low thermal resistance path for heat removal from the IC. The pad is also electrical ground on the MAX3737 and should be soldered to the circuit board ground for proper thermal and electrical performance. Refer to Application Note 862: HFAN-08.1: Thermal Considerations of QFN and Other Exposed-Paddle Packages at [www.maxim-ic.com](http://www.maxim-ic.com) for additional information.
