**General Description**

The MAX3804 driver with integrated analog equalizer compensates up to 20dB of loss at 5GHz. It is designed to ensure PCB board signal integrity up to 12.5Gbps, where frequency-dependent skin effect and dielectric losses typically produce unacceptable amounts of intersymbol interference. The MAX3804 can extend the practical chip-to-chip transmission distance for 10Gbps NRZ serial data up to 30in (0.75m) on FR-4, and it significantly decreases deterministic jitter. Residual jitter after equalization for 10.7Gbps signals is typically 24psP-P on the maximum path length.

The MAX3804 is ideal for 10Gbps chip-to-chip serial interconnections on inexpensive FR-4 material. Its 3mm x 3mm package affords optimal placement and routing flexibility. It has separate VCC connections for internal logic and current-mode logic (CML) I/O. This allows the CML input and output to be referenced to isolated supplies, providing independent DC-coupled interfacing to 1.8V, 2.5V, or 3.3V ICs. Eight discrete levels of input equalization can be selected through a digital control input, enabling the equalizer to be matched to a range of transmission line path loss. When correctly set to match the path loss, the MAX3804 provides optimal performance over a wide range of data rates and formats.

**Features**

- Compensates Up to 30in (0.75m) of 6-mil FR-4 Transmission Line Loss
- 115mW Operating Power
- Up to 12.5Gbps Data Rate
- Compatible with 8B10B, 64B66B, and PRBS Data
- Less than 30psP,P Residual Jitter After Equalization
- 3-Bit Equalization Level Select Input
- 3mm x 3mm Thin QFN Package
- DC-Coupling to 1.8V, 2.5V, or 3.3V CML I/O
- -40°C to +85°C Operation
- +3.3V Core Supply Voltage

**Applications**

- OC-192 and 10Gb Ethernet Switches and Routers
- OC-192 and 10Gb Ethernet Serial Modules
- High-Speed Signal Distribution

12.5Gbps Settable Receive Equalizer

**ABSOLUTE MAXIMUM RATINGS**

Supply Voltage (VCC) ...........................................-0.5V to +4.0V
CML Supply Voltage (VCC1, VCC2) ............-0.5V to (VCC + 0.5V)
Current at Serial Output (SDO+, SDO-) ..........±25mA
Input Voltage (SDI+, SDI-, EQ1, EQ2, EQ3) ...............-0.5V to (VCC + 0.5V)

Continuous Power Dissipation (TA = +85°C) .................................1.398mW
16-Lead Thin QFN-EP (derate 17.5mW/°C above +85°C) .........................
Operating Temperature Range ....................-40°C to +85°C
Storage Temperature Range ......................-55°C to +150°C
Lead Temperature (soldering, 10s) ...................+300°C

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**ELECTRICAL CHARACTERISTICS**

(VCC = +3.0V to +3.6V, VCC1 = VCC2 = +1.65V to +3.6V, TA = -40°C to +85°C. Typical values are at VCC = VCC1 = VCC2 = +3.3V, and TA = +25°C, unless otherwise noted.)

**Note 1:** Differential Input Sensitivity is defined at the input to a transmission line. The transmission line is differential Z0 = 100Ω, 6-mil microstrip in FR-4, εr = 4.5, and tan δ = 0.02. VIN = (SDI+ - SDI-).

**Note 2:** Measured with 0000011111 pattern at 12.5Gbps.

**Note 3:** Residual jitter is the difference in total jitter (RJ, PWD, and PDJ) between the transmitted signal (at the input to the transmission line) and equalizer output. Total residual jitter is DJP-P + 14.2 x RJRMS.

**Note 4:** Measured at 10.7Gbps using a pattern of 100 ones, 2^3PRBS, 100 zeros, 2^3PRBS, and at 12.5Gbps using a K28.5 pattern. Deterministic jitter at the input is from frequency-dependent, media-induced loss only.

**Note 5:** VIN = 400mVP-P to 1200mVP-P, input path is 0 to 30in, 6-mil microstrip in FR-4, εr = 4.5, and tan δ = 0.02.

**Note 6:** Guaranteed by design and characterization.

**Detailed Description**

**General Theory of Operation**

The MAX3804’s low-noise linear input stage includes two amplifiers, one with flat-frequency response, and one with response that compensates for the loss characteristic of an FR-4 PC board transmission line. A current-steering network allows the designer to control the amount of equalization to match the path loss for specific applications. This network consists of a pair of variable attenuators feeding into a summing node. Equalization is set by a 3-bit LVTTL-compatible input (EQ3, EQ2, and EQ1). By employing fixed control of the equalization level, the MAX3804 provides optimal performance for a specific path loss. A high-speed limiting amplifier follows the equalizer circuitry to shape the output signal (see Figure 1).

**CML Input and Output Buffers**

The MAX3804 input and output CML buffers are terminated with 50Ω to VCC1 and VCC2, respectively. The equivalent circuit for the output is shown in Figure 2. Separate supply voltage connections are provided for the core (VCC), input (VCC1), and output (VCC2) circuitry to control noise coupling, and to allow DC-coupling to +1.8V, +2.5V, or +3.3V CML ICs. The CML inputs and outputs can also be AC-coupled.

Use AC-coupling for single-ended cable applications. The unused CML input must be connected through an AC-coupling capacitor to a 50Ω termination. The low-frequency cutoff of the input-stage offset-cancellation circuit is nominally 21kHz.
Applications Information

Equalizer Boost Level Control
The MAX3804 equalizer is intended for use at the receive end of an FR-4 PC board transmission line, typically up to 30in of differential 6-mil stripline or microstrip. It is specifically designed to mitigate intersymbol interference caused by the frequency-dependent path loss of FR-4 transmission lines. It can also be used with a variety of other transmission-line materials and geometries, including coaxial cable, or PC board paths that include well-engineered connectors. Table 1 shows the relationship between nominal 6-mil FR-4 transmission line length and equalization setting.

Supply Voltage Connections
The CML input and output supplies (VCC1, VCC2) can be connected to +1.8V to +3.3V. VCC1 and VCC2 need not be connected to the same supply voltage; however, the core supply (VCC) must be connected to +3.3V.

Package and Layout Considerations
The MAX3804 is packaged in a 3mm x 3mm plastic-encapsulated 16-lead thin QFN package. The package has an exposed pad that provides thermal and electrical connectivity to the IC and must be soldered to a high-frequency ground. Use good layout techniques for the SDI± and SDO± PC board transmission lines, and configure the trace geometry near the IC package to minimize impedance discontinuities. Power-supply decoupling capacitors should be as close as possible to the IC.
