

MAXIM

Serially Controlled, 4-Channel Audio/Video Multiplexers

MAX4586/MAX4587

General Description

The MAX4586/MAX4587 serial-interface, programmable, 4-to-1 channel multiplexers are ideal for multimedia applications. They feature 65Ω on-resistance, 4Ω on-resistance matching between channels, and 5Ω on-resistance flatness. Additionally, they feature -83dB off-isolation at 20kHz and -48dB off-isolation at 10MHz, with -84dB crosstalk at 20kHz and -60dB crosstalk at 10MHz.

The MAX4586 uses a 2-wire, I²C™-compatible serial interface; the MAX4587 uses a 3-wire, SPI™/QSPI™/MICROWIRE™-compatible interface. Both devices are available in 10-pin μMAX packages and are specified for the extended -40°C to $+85^\circ\text{C}$ temperature range.

Features

- ◆ **+2.7V to +5.5V Single-Supply Operation**
- ◆ **4-to-1 Channel Multiplexer**
- ◆ **65Ω (max) R_{ON} with +5V Supply**
- ◆ **Audio Performance**
 - 83dB Off-Isolation at 20kHz
 - 84dB Crosstalk at 20kHz
- ◆ **Video Performance**
 - 48dB Off-Isolation at 10MHz
 - 60dB Crosstalk at 10MHz
- ◆ **Serial Interface**
 - 2-Wire, I²C Compatible (MAX4586)
 - 3-Wire, SPI/QSPI/MICROWIRE Compatible (MAX4587)

Applications

Cellular Phones and Accessories
 Private Mobile Radios (PMRs)
 PC Multimedia Audio/Video Routing
 Industrial Equipment
 Set-Top Boxes
 Video Conferencing
 High-End Audio Equipment

Serially Controlled, 4-Channel Audio/Video Multiplexers

ABSOLUTE MAXIMUM RATINGS

V+ to GND	-0.3V to +6V	Continuous Power Dissipation (T _A = +70°C)
COM and NO ₋ to GND (Note 1)	-0.3V to (V+ + 0.3V)	10-Pin μMAX (derate 4.1mW/°C above +70°C)
A, \overline{CS} , SDA, DIN, SCL, and SCLK to GND	-0.3V to +6V	330mW
Continuous Current into Any Terminal	±20mA	Operating Temperature Range
Peak Current into Any Terminal		-40°C to +85°C
(pulsed at 1ms, 10% duty cycle)	±40mA	Storage Temperature Range
ESD per Method 3015.7	>2kV	-65°C to +150°C
		Lead Temperature (soldering, 10sec)
		+300°C

Note 1: Signals on NO₋ or COM exceeding V+ or ground are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS—Single +5V Supply

(V+ = +5V ±5%, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at T_A = +25°C.) (Note 2)

Fall Time (SCLK, DIN, \overline{CS})	t_F				2	μs
\overline{CS} Pulse Width High	t_{CSW}			40		ns

- Note 2:** Algebraic convention is used in this data sheet; the most negative value is shown in the minimum column.
- Note 3:** Guaranteed by design. Not subject to production testing.
- Note 4:** $\Delta R_{ON} = R_{ON(MAX)} - R_{ON(MIN)}$.
- Note 5:** Resistance flatness is defined as the difference between the maximum and minimum on-resistance values, as measured over the specified analog signal range.
- Note 6:** Leakage parameters are 100% tested at maximum rated temperature and guaranteed by correlation at $T_A = +25^\circ C$.
- Note 7:** Off-isolation = $20 \log(V_{COM} / V_{NO-})$, V_{COM} = output, V_{NO-} = input to off switch.
- Note 8:** All timing is measured from the clock's falling edge preceding the ACK signal for 2-wire and from the rising edge of \overline{CS} for 3-wire. Turn-off time is defined at the output of the switch for a 0.5V change, tested with a 300Ω load to ground. Turn-on time is defined at the output of the switch for a 0.5V change and measured with a $5k\Omega$ load resistor to GND. All timing is shown with respect to 20% V_+ and 70% V_+ , unless otherwise noted.
- Note 9:** Typical values are for MAX4586 devices.
- Note 10:** Leakage testing is guaranteed by testing with a $+5.25V$ supply.
- Note 11:** C_B = capacitance of one bus line in pF. Tested with $C_B = 400pF$.

Typical Operating Characteristics

Pin Description

PIN		NAME	FUNCTION
MAX4586	MAX4587		
1	1	COM	Analog Switch Common Terminal
2	—	A	LSB + 2 of the 2-Wire Serial-Interface Address Field
—	2	\overline{CS}	Chip Select of the 3-Wire Serial Interface
3	—	SDA	Data Input of 2-Wire Serial Interface
—	3	DIN	Data Input of 3-Wire Serial Interface
4	4	V+	Supply Voltage
5	—	SCL	Clock Input of the 2-Wire Serial Interface
—	5	SCLK	Clock Input of the 3-Wire Serial Interface
6	6	NO1	Mux Normally Open Output 1
7	7	NO2	Mux Normally Open Output 2
8	8	GND	Ground
9	9	NO3	Mux Normally Open Output 3
10	10	NO4	Mux Normally Open Output 4

Detailed Description

The MAX4586/MAX4587 are serial-interface, programmable multiplexers. Each device contains a 4-to-1 normally open (NO) multiplexer. Each switch is independently controlled through the on-chip serial interface. The MAX4586 uses a 2-wire, I²C-compatible serial communications protocol, and the MAX4587 uses a 3-wire, SPI/QSPI/MICROWIRE-compatible serial communications protocol.

These devices operate from a single +2.7V to +5.5V supply and are optimized for use with an audio frequency at 20kHz and video frequencies up to 10MHz. They feature 65 Ω on-resistance, 4 Ω on-resistance matching between channels, and 5 Ω on-resistance flatness. Audio off-isolation is -83dB at 20kHz and crosstalk is at least -84dB at 20kHz, while video off-isolation is -48dB at 10MHz and crosstalk is at least -60dB at 10MHz.

Applications Information

Multiplexer Control

The MAX4586/MAX4587 have a common command-bit structure; the only difference between them is the interface type (2-wire or 3-wire, respectively).

The command controls the open/closed states of the various switches. Table 1 shows the configuration of the data bits and their related switches. After a command is issued, a logic “1” in any data-bit location closes the associated switch, while a logic “0” opens it (Table 2).

2-Wire Serial Interface

The MAX4586 uses a 2-wire, I²C-compatible serial interface. The COM_ register uses the “SendByte” protocol that consists of an address byte followed by a command byte (Table 1).

To address a given chip, the A bit in the address byte must duplicate the value present at the A pin of that chip. The rest of the address bits must match those shown in Table 3. The command byte details are described in the *Switch Control* section.

The 2-wire serial interface requires only two I/O lines of a standard microprocessor (μ P) port. Figures 1 and 2 detail the timing diagram for signals on the 2-wire bus, and Tables 1 and 3 detail the format of the signals. The MAX4586 is a receive-only device and must be controlled by the bus master device. A bus master device communicates by transmitting the address byte of the slave device over the bus and then transmitting the desired information. Each transmission consists of a start condition, an address byte, a command byte, and finally a stop condition. The slave device acknowledges the recognition of its address by pulling the SDA line low for one clock period after the address byte is transmitted. The slave device also issues a similar acknowledgment after the command byte.

Serially Controlled, 4-Channel Audio/Video Multiplexers

Table 1. Command-Bit Mapping

COMMAND BIT	SWITCH	TERMINALS	POWER-UP STATE
D7 (MSB)	x		x
D6	x		x
D5	x		x
D4	x		x
D3	NO4 to COM	10, 1	0 (Open)
D2	NO3 to COM	9, 1	0 (Open)
D1	NO2 to COM	7, 1	0 (Open)
D0 (LSB)	NO1 to COM	6, 1	0 (Open)

X = Don't care

0	OPEN
1	CLOSED

Table 3. Address Bit Map

ADDRESS BIT (A)	ADDRESS
0	0110 1010
1	0110 1110

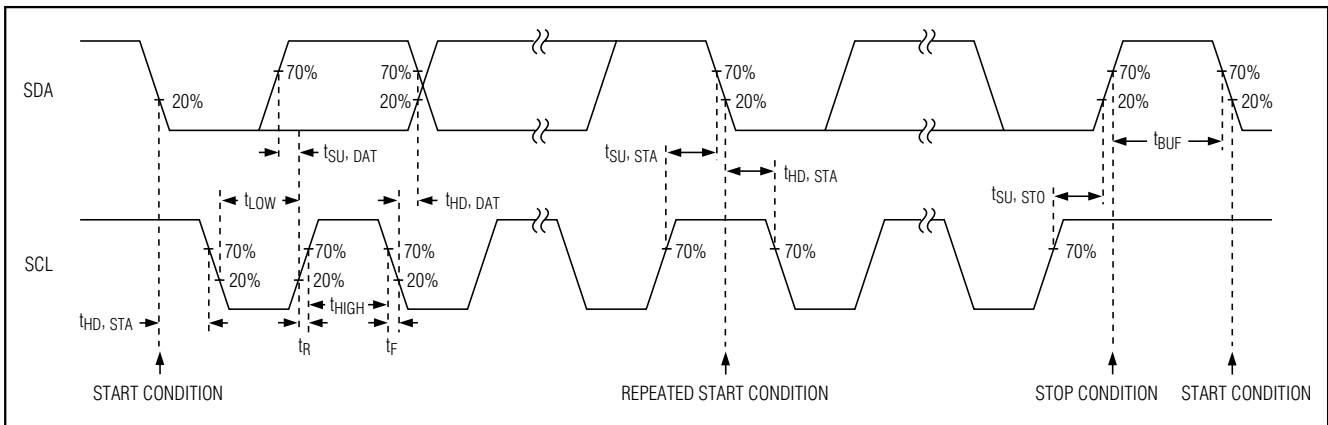

Figure 1. 2-Wire Serial-Interface Timing Diagram

Figure 2. Complete 2-Wire Serial-Interface Transmission

Start and Stop Conditions

The bus master signals the beginning of a transmission with a start condition by transitioning SDA from high to low while SCL is high. When the bus master has finished communicating with the slave device, it issues a stop condition by transitioning SDA from low to high while SCL is high. The bus master is then free for another transmission.

Slave Address (Address Byte)

The MAX4586 uses an 8-bit-long slave address. To select a slave address, connect A to V+ or GND. The MAX4586 has two possible slave addresses, so a maximum of two of these devices may share the same address line. The slave device MAX4586 monitors the serial bus continuously, waiting for a start condition followed by an address byte. When a slave device recog-

Serially Controlled, 4-Channel Audio/Video Multiplexers

Figure 3. 3-Wire Serial-Interface Timing Diagram

Figure 4. Complete 3-Wire Serial Transmission

nizes its address (01101A10), it acknowledges that it is ready for further communication by pulling the SDA line low for one clock period.

3-Wire Serial Interface

The MAX4587 3-wire serial interface is SPI/QSPI/MICROWIRE compatible. An active-low chip-select (\overline{CS}) input enables the device to receive data for the serial input (DIN). Data is clocked in on the rising edge of the serial-clock (SCLK) signal. A total of 8 bits is needed in each write cycle. The first bit clocked into the MAX4587 is the command byte's MSB, and the last bit clocked in is the data byte's LSB. The first four bits

of the command byte are "don't care." While shifting data, the device remains in its original configuration. After all eight bits are clocked into the input shift register, a rising edge on \overline{CS} latches the data into the MAX4587 internal registers, initiating the device's change of state. Figures 3 and 4 detail the 3-wire protocol, and Table 1 details the command byte format.

Addressable Serial Interface

To program several MAX4587s individually using a single processor, connect DIN of each MAX4587 together and control \overline{CS} on each MAX4587 separately. To select a particular device, drive the corresponding \overline{CS} low, clock in the 8-bit command, then drive \overline{CS} high to execute the command. Typically, only one MAX4587 is addressed at a time.

Power-Up State

The MAX4586/MAX4587 feature a preset power-up state. See Table 1 to determine the power-up state of the devices.
