**General Description**

The MAX6675 evaluation kit (EV kit) is an assembled and tested printed circuit board (PCB) that demonstrates the MAX6675 thermocouple digital temperature sensor. It accepts the input from a type-K thermocouple and converts the temperature to 12-bit data.

The MAX6675 EV kit connects to a computer for acquiring the data from the MAX6675. Windows® 95/98/2000/XP compatible software provides a user-friendly interface to display the 12-bit data and convert it to a temperature.

The EV kit includes a type-K thermocouple for evaluation up to +80°C.

To evaluate the MAX6674, order a free sample of the MAX6674 ISA.

**Features**

- Digitizes and Displays Temperature from a Type-K Thermocouple
- SPI™-Compatible Serial Interface
- Easy-to-Use Menu-Driven Software
- Available in an 8-Pin SO Package
- Fully Assembled and Tested
- Includes Windows 95/98/2000/XP-Compatible Software, Demo PCB, and Type-K Thermocouple

**Quick Start**

**Required Equipment**

Before beginning, the following equipment is needed:

- DC power supply capable of supplying any voltage between 7V and 20V at 100mA
- A user-supplied Windows 95/98/2000/XP-compatible PC with an available parallel port (female DB-25 connector on back of PC)
- A standard 25-pin, straight-through, male-to-female cable to connect the PC’s parallel port to the MAX6675 EV kit board

**Note:** In the following sections, software-related items are identified by bolding. Text in **bold** refers to items directly from the EV kit software. Text in **bold and underlined** refers to items from the Windows 95/98/2000/XP operating system.

**Procedure**

The MAX6675 is fully assembled and tested. Follow the steps below to verify board operation. **Caution:** Do not turn on the power supply until all connections are complete.

1) Connect a 25-pin, straight-through, male-to-female cable from the PC’s parallel port to the MAX6675 EV kit board.

Windows is a registered trademark of Microsoft Corp.

SPI is a trademark of Motorola, Inc.
2) Visit the Maxim website (www.maxim-ic.com/evkitsoftware) to download the latest version of the EV kit software, 6675Rxx.ZIP. Install the MAX6675 evaluation software on your computer by running the INSTALL.EXE program. The program files are copied and icons are created in the Windows Start menu. When you see the self-extracting DLPortIO driver install window appear on the screen, press the Yes button. This automatically unpacks the compressed files and runs the DLPortIO driver installer. If using Windows 2000 or XP, you must have administrator privileges on your PC. If you do not, contact your system administrator to allow installation. You need to restart your PC after installing the DLPortIO driver.

3) Connect the 7V to 20V supply to the pads labeled VIN and GND.

4) Turn on the power supply.

5) Start the MAX6675 program by opening its icon in the Start menu.

6) Observe as the program automatically detects the MAX6675 and starts the main program (Figure 1).

**Detailed Description**

**User-Interface Panel**

The user interface is easy to operate. Use either the mouse or the Tab key to navigate.

**Note:** Words in boldface are user-selectable features in the software.

The program continually polls the device for new temperature data. To disable the continuous polling of data, uncheck the Automatic Read checkbox. Press Read Temp to get the current temperature.

**Data Logging**

Check the Data Logging checkbox to activate data logging. Data logging saves temperature and status data to a text file that includes a time/date stamp next to each data point. If Automatic Read is enabled, data is sampled at 1Hz; however, the data is logged to the file only if the temperature changes. This slows the growth of the data-logging file. When Automatic Read is disabled, the data is logged each time the Read Temp button is clicked. To stop data logging, uncheck the Data Logging checkbox.

**General-Purpose SPI Utility**

There are two methods for communicating with the MAX6675: through the user-interface panel or through the general-purpose SPI utility. This utility (Figure 2) configures SPI parameters such as clock polarity (CPOL), clock phase (CPHA), and chip-select (CS) polarity.

The fields where pin numbers are required apply to the pins of the parallel port connector.

The utility handles the data only in byte (8-bit) format. Data longer than 1 byte must be handled as multiple bytes. For example, a 16-bit word should be broken into two 8-bit bytes.

To write data to the slave device, enter the data into the field labeled: Data bytes to be written. Each data byte should be hexadecimal, prefixed by 0x, and separated with a comma. Press the Send Now button to write the data to the slave.

**Note:** The MAX6675 is a read-only device and cannot be written to.

To read data from the slave device, the field: Data bytes to be written: must contain hexadecimal values, includes the same number of bytes as to be read from the slave. For example, to read 16-bit data from the MAX6675, 2 bytes must be written, each prefixed by 0x and separated by a comma (default is 0x00, 0x00).

**Note:** When using the SPI utility, uncheck the Automatic Read checkbox in the main display.

**Evaluating with a Lower Supply Voltage**

The MAX6675 EV kit is configured for operating at 5V. To evaluate the MAX6675 at a lower supply voltage, cut the traces shorting the pins of JU1. Apply the desired voltage (between 3V and 5V) to the VCC pad. **Note:** A 7V to 20V supply must be connected to VIN to power the MAX1840 level translator.
MAX6675 Evaluation Kit

Connecting to a Microcontroller
The MAX6675 EV kit can be monitored externally with a microcontroller or other control device by cutting the traces shorting the pins of JU2, JU3, and JU4 and connecting to the pads labeled SCK, CS, and SO.

Evaluating the MAX6674
The MAX6675 EV kit can also evaluate the MAX6674. Remove the MAX6675 from the board and install the new part. Select the MAX6674 radio button on the main display of the software.

Open Thermocouple Detection
To enable the Open Thermocouple Detection, install a shunt on jumper JU6. This connects pin 2 of the MAX6675 to ground.
