**General Description**

The MAX7474 adaptive equalizer recovers losses incurred in the transmission of a composite video (CVBS) signal over unshielded twisted-pair (UTP) cable. The device fully recovers losses for cable lengths of up to 300m and greatly improves signal quality for cable lengths of up to 600m. The device automatically adapts to all cable lengths for CVBS signals with color burst and allows fixed-equalization settings for video signals without burst. The MAX7474 is optimized to provide compensation for losses that occur when transmitting composite video signals over UTP cables such as Category 5e. The device compensates for low frequency and chroma band losses. The MAX7474 is compatible with NTSC and PAL standards.

The MAX7474 accepts differential input and provides a single-ended output. The output is capable of driving two AC- or DC-coupled standard 150Ω video loads. The output back-porch DC level is adjustable with an externally applied DC voltage at the BPLVL input. The device also features loss-of-sync (LOS) and loss-of-burst (LOB) logic outputs.

The MAX7474 is available in a 16-pin SSOP package and is fully specified over the extended (-40°C to +85°C) temperature range.

**Applications**

Security Video Systems  
Video Switching Systems  
Home Automation

**Features**

- Automatically Equalizes Up to 600m (Fully Recovers Losses Up to 300m) of UTP Cable Carrying CVBS
- Automatic Switchover to Fixed Equalization for CVBS Without Color Burst
- Integrated Video Driver with Adjustable Back-Porch Clamp Level
- LOS and LOB Output
- NTSC and PAL Compatible
- 16-Pin SSOP Package

### Adaptive Equalizer for Video Over Twisted Pair

#### ABSOLUTE MAXIMUM RATINGS

- $V_{CC}$ to GND: $-0.3$ V to $+6$ V
- All Other Pins to GND: $-0.3$ V to (min of $6$ V or $V_{CC} + 0.3$ V)
- Maximum Continuous Current into Any Input or Output: $\pm 50$ mA
- Continuous Power Dissipation (TA = $+70$ °C): $571.4$ mW

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

#### ELECTRICAL CHARACTERISTICS

$(V_{CC} = +4.75$ V to $+5.25$ V, $R_L = 150$ Ω (AC-coupled), $FEQ1 = GND$, $FEQ0 = GND$, $V_{BPLVL} = 1.4$ V, $TA = -40$ °C to $+85$ °C, unless otherwise noted. Typical values are at $TA = +25$ °C.)

### Detailed Description

The MAX7474 compensates for cable losses that occur when transmitting a composite video signal over unshielded twisted-pair cable (see the Typical Application Circuit). The device automatically adapts to cable length by monitoring the sync and color-burst amplitudes of the color video signal at the output (OUT) and adjusting the gains accordingly. Video signals without burst are automatically detected and a user-selectable fixed equalization is applied to the signal. The MAX7474 provides full equalization up to 300m of Category 5e cable and greatly improves performance up to 600m.

The MAX7474 accepts differential video input signals in NTSC or PAL standards. The MAX7474 includes an output unity-gain video driver and adjustable back-porch DC level. The device also features LOS and LOB logic outputs.

**Video Input**

The MAX7474 accepts a differential video input with a maximum 2.4VP-p voltage swing. A twisted-pair cable carries the differential video signal to the positive (INP) and negative (INN) inputs, which are AC-coupled with 0.022µF capacitors. Each input is internally clamped to a DC level (see the Input Clamp section).

### Input Clamp

The MAX7474 clamps the sync tip of the input signal to internally set DC levels effectively correcting, on a line-by-line basis, any shift in the sync-tip level of the input video signal. The sync-tip of the positive video input signal (VinP) is clamped to typically 2.0V and the negative video input signal (VinN) is clamped to typically 3.2V. The input clamp enables capacitive coupling of the input, permitting a large common-mode DC difference between the line driver (camera) and the device.

### Adaptive Equalizer

The adaptive equalizer in the MAX7474 provides the appropriate inverse frequency response needed to compensate for UTP cable loss. The equalizer adjusts the low-frequency amplitude and chroma amplitude of the input CVBS signal. The low-frequency component of the CVBS is adjusted according to the feedback information obtained from the internal automatic gain control (AGC) circuit, which monitors the sync pulse amplitude of the output signal (see the Automatic Gain Control (AGC) section). The chroma gain of the video signal is adjusted according to the feedback information obtained from the internal automatic equalization control circuit, which monitors the color-burst amplitude of the output signal (see the Automatic Equalization Control (AEQ) section).
The chroma gain for the MAX7474 is automatically adjusted between 0dB and +12dB, while the low-frequency gain is automatically adjusted between -6dB and +3.6dB, providing full equalization for cable losses that can occur when using up to 300m of UTP cable to transmit CVBS signal with color burst.

**Automatic Gain Control (AGC)**
The automatic gain control circuit corrects low-frequency signal losses such that the output signal obtains a nominal sync level (VSYNC_OUT) of 293mV. Differential input sync pulse amplitude in the 210mVP-P and 600mVP-P range is automatically adjusted to the nominal output sync level (VSYNC_OUT).

If the sync is lost for 32 consecutive horizontal lines, the LOS output goes high and OUT is set to a high-impedance state.

**Automatic Equalization Control (AEQ)**
The automatic equalization control circuit corrects the chroma signal attenuation such that the output-signal burst amplitude is 293mV (subcarrier frequency, fSC = 3.58MHz or 4.43MHz). Differential input color-burst amplitude in the 76mVP-P and 300mVP-P range is automatically adjusted to the nominal output color-burst level (VBURST_OUT).

The AGC and AEQ equalization take approximately 1s (16,384 lines) to change from the lowest gain to the highest gain. During this time, the chroma amplitude is gradually increased from minimum to maximum.

**Fixed Equalization Mode (LOB Is High)**
If the color-burst amplitude at the output of the MAX7474 (OUT) is less than 80mVP-P with the equalizer gain set to maximum for 32 consecutive horizontal lines, the loss-of-burst output (LOB) goes high. LOB returns low when color bursts with amplitude greater than 80mVP-P are present at OUT for 32 consecutive horizontal lines.

For applications where the input signal has no color burst, or the input burst amplitude is lower than the LOB threshold voltage (VLOB), the MAX7474 asserts LOB and automatically applies a user-defined fixed equalization set by logic inputs FEQ1 and FEQ0 (see Table 1). When using cable lengths greater than 75m, set the fixed equalization level according to Table 1, or higher, to ensure the device comes out of the fixed equalization mode. If the fixed equalization is set to a lower gain setting than specified in Table 1, the amplitude of the color-burst signal at the output may remain smaller than the LOB threshold (VLOB) of 80mVP-P, keeping the device in LOB mode (see the Automatic Equalization Control (AEQ) section). If the conditions in Table 1 are not met, set FEQ1 to high to ensure the device always comes out of LOB mode for longer cable lengths.

**Output Video Driver**
The MAX7474 features a single-ended video output driver with 0dB gain. The typical output voltage swing of the output driver is 1.2VP-P. The output driver is capable of driving two AC-coupled or DC-coupled 150Ω video loads. The output back-porch DC level is set by an internal back-porch clamp circuit (see the Back-Porch Clamp section). OUT enters a high-impedance state when sync is lost for 32 consecutive horizontal lines, asserting LOS.

**Back-Porch Clamp**
The MAX7474 features a back-porch clamp to set the output blanking level. This clamp shifts the DC level of the video signal so that the back-porch level is approximately equal to the voltage level on the BPLVL input. The voltage range allowed at the BPLVL input is 1V to 1.6V.

**Applications Information**

**Differential UTP Input Interface**
Applications with differential input interface require proper input voltage levels, termination, and AC-coupling (Figure 1). The maximum differential input voltage swing allowed is 2.4V. Use active drivers to drive the cable as shown in Figure 1. For Category 5e cables, the proper termination resistance is 50Ω to ground at INN and INP inputs. Apply a 0.022µF coupling capacitor at each input.

**Output Interface**
The video output is capable of driving an AC-coupled or DC-coupled load. Use a 220µF or larger coupling capacitor for AC-coupling. Figure 1 shows applications with AC- and DC-coupled output interface.

**Security Systems Application**
Security systems typically consist of many cameras that are viewed and recorded on a relatively smaller number.
Adaptive Equalizer for Video Over Twisted Pair

Power Supply, Grounding, and Layout
The MAX7474 operates from a +4.75V to +5.25V single supply. Connect both Vcc inputs together and bypass each one with a 0.1µF capacitor to GND. Connect the 0.1µF capacitors as close as possible to the device to minimize the loop formed when the bypass capacitor is connected to the device, thus avoiding additional inductance that could resonate with the capacitor. For optimum performance, use a ground plane and keep the input and output traces away from each other.
